Introduction

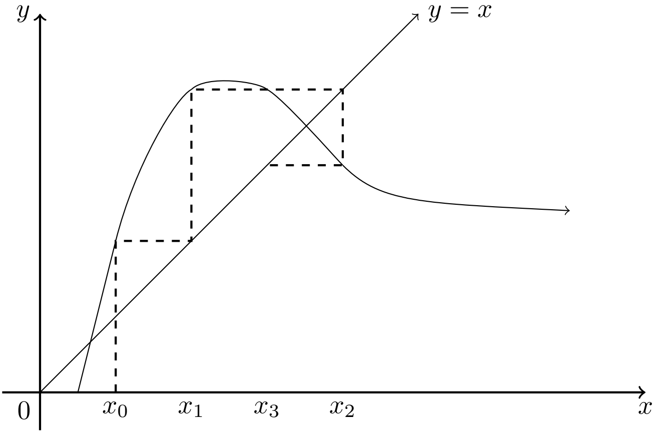
Let $f : I \to I$ be a continuous map, and I be an interval. *Interval* is a connected subset of the real line which contains more than one point. $< a, b >$ is a closed interval with endpoints a and b.

$$f^1 = f,\ f^{n+1} = f \circ f^n,\ n \geq 1$$

Introduction

Let $f : I \to I$ be a continuous map, and I be an interval. *Interval* is a connected subset of the real line which contains more than one point. $< a, b >$ is a closed interval with endpoints a and b.

$$f^1 = f,\ f^{n+1} = f \circ f^n,\ n \geq 1$$



Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x.

Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x. $c \in I$ is a fixed point if $f(c) = c$.

Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x. $c \in I$ is a fixed point if $f(c) = c$. If $I = [a, b]$ is compact $\Rightarrow \exists$ a fixed point $c \in I$, since

$$f(a) - a \geq 0 \geq f(b) - b$$

Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x. $c \in I$ is a fixed point if $f(c) = c$. If $I = [a, b]$ is compact $\Rightarrow \exists$ a fixed point $c \in I$, since

$$f(a) - a \geq 0 \geq f(b) - b$$

A point $c \in I$ is said to be periodic point of f with period m if $f^m(c) = c$, $f^k(c) \neq c$ for $1 \leq k < m$.

Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x. $c \in I$ is a fixed point if $f(c) = c$. If $I = [a, b]$ is compact $\Rightarrow \exists$ a fixed point $c \in I$, since

$$f(a) - a \geq 0 \geq f(b) - b$$

A point $c \in I$ is said to be periodic point of f with period m if $f^m(c) = c$, $f^k(c) \neq c$ for $1 \leq k < m$. Periodic m-orbit is

$$c, f(c), f^2(c), \cdots, f^{m-1}(c)$$

Sharkovski's Theorem

$\{f^n(x) : n \geq 0\}$ be an orbit of x. $c \in I$ is a fixed point if $f(c) = c$. If $I = [a, b]$ is compact $\Rightarrow \exists$ a fixed point $c \in I$, since

$$f(a) - a \geq 0 \geq f(b) - b$$

A point $c \in I$ is said to be periodic point of f with period m if $f^m(c) = c$, $f^k(c) \neq c$ for $1 \leq k < m$. Periodic m-orbit is

$$c, f(c), f^2(c), \cdots, f^{m-1}(c)$$

Theorem 1

(Sharkovsky, 1964) Let the positive integers be totally ordered in the following way:

$$1 \succ 2 \succ 2^2 \succ 2^3 \succ ... \succ 2^2{\cdot}5 \succ 2^2{\cdot}3 \succ ... \succ 2{\cdot}5 \succ 2{\cdot}3 \succ ... \succ 7 \succ 5 \succ 3$$

If f has a cycle of period n and $m \succ n$, then f also has a periodic orbit of period m.

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof. If $J = [a, b]$ then for some $c, d \in J$ we have $f(c) = a$, $f(d) = b$. Thus $f(c) \leq c$, $f(d) \geq d$, and by the intermediate value theorem $\exists c_* \in [a, b]\ f(c_*) = c_*$. □

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof. If $J = [a, b]$ then for some $c, d \in J$ we have $f(c) = a$, $f(d) = b$. Thus $f(c) \leq c$, $f(d) \geq d$, and by the intermediate value theorem $\exists c_* \in [a, b]$ $f(c_*) = c_*$. □

Lemma 3

If J, K are compact subintervals such that $K \subseteq f(J)$, then there is a compact subinterval $L \subseteq J$ such that $f(L) = K$.

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof. If $J = [a, b]$ then for some $c, d \in J$ we have $f(c) = a$, $f(d) = b$. Thus $f(c) \leq c$, $f(d) \geq d$, and by the intermediate value theorem $\exists c_* \in [a, b]\ f(c_*) = c_*$. $\square$

Lemma 3

If J, K are compact subintervals such that $K \subseteq f(J)$, then there is a compact subinterval $L \subseteq J$ such that $f(L) = K$.

Proof. Let $K = [a, b], c = \sup\{x \in J : f(x) = a\}$. If $f(x) = b$ for some $x \in J$ with $x > c$, let d be the least and take $L = [c, d]$.

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof. If $J = [a, b]$ then for some $c, d \in J$ we have $f(c) = a$, $f(d) = b$. Thus $f(c) \leq c$, $f(d) \geq d$, and by the intermediate value theorem $\exists c_* \in [a, b]\ f(c_*) = c_*$. $\square$

Lemma 3

If J, K are compact subintervals such that $K \subseteq f(J)$, then there is a compact subinterval $L \subseteq J$ such that $f(L) = K$.

Proof. Let $K = [a, b], c = \sup\{x \in J : f(x) = a\}$. If $f(x) = b$ for some $x \in J$ with $x > c$, let d be the least and take $L = [c, d]$. Otherwise $f(x) = b$ for some $x \in J$ with $x < c$.

Proof of Sharkovski's Theorem

Lemma 2

If J is a compact subinterval such that $J \subseteq f(J)$, then f has a fixed point in J.

Proof. If $J = [a, b]$ then for some $c, d \in J$ we have $f(c) = a$, $f(d) = b$. Thus $f(c) \leq c$, $f(d) \geq d$, and by the intermediate value theorem $\exists c_* \in [a, b]\ f(c_*) = c_*$. □

Lemma 3

If J, K are compact subintervals such that $K \subseteq f(J)$, then there is a compact subinterval $L \subseteq J$ such that $f(L) = K$.

Proof. Let $K = [a, b], c = \sup\{x \in J : f(x) = a\}$. If $f(x) = b$ for some $x \in J$ with $x > c$, let d be the least and take $L = [c, d]$. Otherwise $f(x) = b$ for some $x \in J$ with $x < c$. Let c' be the greatest and let $d' \leq c$ be the least $x \in J$ with $x > c'$ for which $f(x) = a$. Then we can take $L = [c', d']$. □

Proof of Sharkovski's Theorem

Lemma 4

If $J_0, J_1, ..., J_m$ *are compact subintervals such that* $J_k \subseteq f(J_{k-1})$ $(1 \leq k \leq m)$*, then there is a compact subinterval* $L \subseteq J_0$ *such that* $f^m(L) = J_m$ *and* $f^k(L) \subseteq J_k$ $(1 \leq k < m)$*.*

Proof of Sharkovski's Theorem

Lemma 4

If $J_0, J_1, ..., J_m$ *are compact subintervals such that* $J_k \subseteq f(J_{k-1})$ $(1 \leq k \leq m)$, *then there is a compact subinterval* $L \subseteq J_0$ *such that* $f^m(L) = J_m$ *and* $f^k(L) \subseteq J_k$ $(1 \leq k < m)$.
If also $J_0 \subseteq J_m$, *then there exists a point* y *such that* $f^m(y) = y$ *and* $f^k(y) \in J_k$ $(0 \leq k < m)$.

Lemma 4

If $J_0, J_1, ..., J_m$ are compact subintervals such that $J_k \subseteq f(J_{k-1})$ $(1 \leq k \leq m)$, then there is a compact subinterval $L \subseteq J_0$ such that $f^m(L) = J_m$ and $f^k(L) \subseteq J_k$ $(1 \leq k < m)$.
If also $J_0 \subseteq J_m$, then there exists a point y such that $f^m(y) = y$ and $f^k(y) \in J_k$ $(0 \leq k < m)$.

Proof. Note that the first assertion holds for $m = 1$ due to Lemma 3:

$$J_1 \subseteq f(J_0) \Rightarrow \exists L \subseteq J_0, f(L) = J_1$$

Prove by induction: let $m > 1$ be fixed and assume the assertion is true for all smaller values. We have

$$J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), ..., J_{m-1} \subseteq f(J_{m-2}), J_m \subseteq f(J_{m-1})$$

Induction assumption applied to last $m - 1$ relations $\Rightarrow$

$$\exists L' \subseteq J_1 : f^{m-1}(L') = J_m, f^k(L') \subseteq J_{k+1}, 1 \leq k < m - 1$$

Proof of Sharkovski's Theorem

Now we have $L' \subseteq J_1 \subseteq f(J_0) \Rightarrow \exists L \subseteq J_0$ such that $f(L) = L' \subseteq J_1 \Rightarrow$

$$f^m(L) = f^{m-1}(L') = J_m;\ f^k(L) = f^{k-1}(L') \subseteq J_k, 2 \leq k < m$$

Hence first assertion of the lemma is proved.

Proof of Sharkovski's Theorem

Now we have $L' \subseteq J_1 \subseteq f(J_0) \Rightarrow \exists L \subseteq J_0$ such that $f(L) = L' \subseteq J_1 \Rightarrow$

$$f^m(L) = f^{m-1}(L') = J_m;\ f^k(L) = f^{k-1}(L') \subseteq J_k, 2 \leq k < m$$

Hence first assertion of the lemma is proved.
If also $J_0 \subseteq J_m$, from the first assertion $\Rightarrow$

$$\exists L \subseteq J_0 :\ f^m(L) = J_m \supseteq J_0 \supseteq L$$

and by Lemma 2 we have

$$\exists c \in L \subseteq J_0 :\ f^m(c) = c, \text{and } f^k(c) \subseteq J_k, 1 \leq k < m$$

Lemma 4 is proved. □

Proof of Sharkovski's Theorem

Lemma 5

Between any two points of a periodic orbit of period $n > 1$ there is a point of a periodic orbit of period less than n.

Proof. Let $a < b$ are two adjacent points of n-orbit. Consider all $m < n$ such that $f^m(b) < b$. There is at least one such m. Since there is one more point of the orbit to the left of b than to the left of a, for some m such that $1 \leq m < n$ we have $f^m(a) > a$, $f^m(b) < b$. If f^m is defined on $[a, b]$, then $\exists c \in (a, b)$ $f^m(c) = c$.

Proof of Sharkovski's Theorem

Lemma 5

Between any two points of a periodic orbit of period $n > 1$ there is a point of a periodic orbit of period less than n.

Proof. Let $a < b$ are two adjacent points of n-orbit. Consider all $m < n$ such that $f^m(b) < b$. There is at least one such m. Since there is one more point of the orbit to the left of b than to the left of a, for some m such that $1 \leq m < n$ we have $f^m(a) > a$, $f^m(b) < b$. If f^m is defined on $[a, b]$, then $\exists c \in (a, b)\ f^m(c) = c$.
Assume f^m is not defined throughout $[a, b]$. Let $J_k =< f^k(a), f^k(b) >$, $1 \leq k \leq m$. We have

$$J_k \subseteq f(J_{k-1}),\ 1 \leq k \leq m$$

We also have $J_0 \subseteq J_m$, since $f^m(a) \geq b$, $f^m(b) \leq a$. hence, the assertion of the Lemma follows from Lemma 4. $\square$

Proof of Sharkovski's Theorem

Let $\mathbf{B} = \{x_1 < x_2 < \cdots < x_n\}$ be n-orbit of f.

Definition 1.1

If $f(x_i) = x_{s_i}, 1 \leq s_i \leq n, i = 1, 2, ..., n$, then $\mathbf{B}$ is associated with cyclic permutation

$$\begin{bmatrix} 1 & 2 & \dots & n \\ s_1 & s_2 & \dots & s_n \end{bmatrix}$$

Definition 1.2

Let $I_i = [x_i, x_{i+1}]$. Digraph of a cycle is a directed graph of transitions with vertices $I_1, I_2, \cdots, I_{n-1}$ and oriented edges $I_i \to I_s$ if $I_s \subseteq f(I_i)$.

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.
2. $\forall\ I_k\ \exists$ at least one I_j for which $I_j \to I_k$. Moreover, it is always possible to choose $j \neq k$, unless n is even and $k = \frac{n}{2}$.

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.
2. $\forall\ I_k\ \exists$ at least one I_j for which $I_j \to I_k$. Moreover, it is always possible to choose $j \neq k$, unless n is even and $k = \frac{n}{2}$.
   Proof: Suppose there is no $j \neq k$ such that $I_j \to I_k$. Then if $i \neq k$, $f(x_i) \leq x_k \Rightarrow f(x_{i+1}) \leq x_k$ and $f(x_i) \geq x_{k+1} \Rightarrow f(x_{i+1}) \geq x_{k+1}$.

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.
2. $\forall\ I_k\ \exists$ at least one I_j for which $I_j \to I_k$. Moreover, it is always possible to choose $j \neq k$, unless n is even and $k = \frac{n}{2}$.
   Proof: Suppose there is no $j \neq k$ such that $I_j \to I_k$. Then if $i \neq k$, $f(x_i) \leq x_k \Rightarrow f(x_{i+1}) \leq x_k$ and $f(x_i) \geq x_{k+1} \Rightarrow f(x_{i+1}) \geq x_{k+1}$. If $f(x_{k+1}) \geq x_{k+1} \Rightarrow f(x_i) \geq x_{k+1}$ for $k < i \leq n \Rightarrow$ proper subset $\{x_{k+1}, ..., x_n\}$ is mapped to itself. Hence, $f(x_{k+1}) \leq x_k$, and similarly $f(x_k) \geq x_{k+1}$, and accordingly there is a loop $I_k \to I_k$.

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.
2. $\forall\ I_k\ \exists$ at least one I_j for which $I_j \to I_k$. Moreover, it is always possible to choose $j \neq k$, unless n is even and $k = \frac{n}{2}$.
   Proof: Suppose there is no $j \neq k$ such that $I_j \to I_k$. Then if $i \neq k$, $f(x_i) \leq x_k \Rightarrow f(x_{i+1}) \leq x_k$ and $f(x_i) \geq x_{k+1} \Rightarrow f(x_{i+1}) \geq x_{k+1}$. If $f(x_{k+1}) \geq x_{k+1} \Rightarrow f(x_i) \geq x_{k+1}$ for $k < i \leq n \Rightarrow$ proper subset $\{x_{k+1}, ..., x_n\}$ is mapped to itself. Hence, $f(x_{k+1}) \leq x_k$, and similarly $f(x_k) \geq x_{k+1}$, and accordingly there is a loop $I_k \to I_k$.

$$f(x_i) \leq x_k, k < i \leq n \ \Rightarrow n - k \leq k \Rightarrow n \leq 2k,$$

$$f(x_i) \geq x_{k+1}, 1 \leq i \leq k \Rightarrow k \leq n - k \Rightarrow n \geq 2k \Rightarrow n = 2k \quad \square$$

Proof of Sharkovski's Theorem

Properties of Digraphs:

1. $\forall\ I_j\ \exists$ at least one I_k for which $I_j \to I_k$. Moreover, it is always possible to choose $k \neq j$, unless $n = 2$.
2. $\forall\ I_k\ \exists$ at least one I_j for which $I_j \to I_k$. Moreover, it is always possible to choose $j \neq k$, unless n is even and $k = \frac{n}{2}$.
   Proof: Suppose there is no $j \neq k$ such that $I_j \to I_k$. Then if $i \neq k$, $f(x_i) \leq x_k \Rightarrow f(x_{i+1}) \leq x_k$ and $f(x_i) \geq x_{k+1} \Rightarrow f(x_{i+1}) \geq x_{k+1}$. If $f(x_{k+1}) \geq x_{k+1} \Rightarrow f(x_i) \geq x_{k+1}$ for $k < i \leq n \Rightarrow$ proper subset $\{x_{k+1}, ..., x_n\}$ is mapped to itself. Hence, $f(x_{k+1}) \leq x_k$, and similarly $f(x_k) \geq x_{k+1}$, and accordingly there is a loop $I_k \to I_k$.
   $$f(x_i) \leq x_k, k < i \leq n \ \ \Rightarrow n - k \leq k \Rightarrow n \leq 2k,$$
   $$f(x_i) \geq x_{k+1}, 1 \leq i \leq k \Rightarrow k \leq n - k \Rightarrow n \geq 2k \Rightarrow n = 2k \quad \square$$
3. Digraph always contains a loop
   We have $f(x_1) > x_1, f(x_n) < x_n$. Let
   $$k = \min\{1 \leq j < n : f(x_j) \geq x_{j+1}, f(x_{j+1}) \leq x_j\}$$
   Then $I_k \to I_k$.

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

FC always exists and unique.

Proof of Sharkovski's Theorem

Fundamental Cycle

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

FC always exists and unique. In the FC some vertex must occur at least twice among $J_0, ..., J_{n-1}$, since digraph has only $n-1$ vertices.

Proof of Sharkovski's Theorem

Fundamental Cycle

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

FC always exists and unique. In the FC some vertex must occur at least twice among $J_0, ..., J_{n-1}$, since digraph has only $n-1$ vertices. On the other hand, every vertex occurs at most twice, since interval I_k has two endpoints.

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

FC always exists and unique. In the FC some vertex must occur at least twice among $J_0, ..., J_{n-1}$, since digraph has only $n-1$ vertices. On the other hand, every vertex occurs at most twice, since interval I_k has two endpoints.

Definition 1.4

Cycle in a digraph is said to be primitive if it does not consisit entirely of a cycle of smaller length described several times.

Proof of Sharkovski's Theorem

Fundamental Cycle

Definition 1.3

Given n-orbit, a cycle

$$J_0 \to J_1 \to \cdots \to J_{n-1} \to J_0$$

of length n in the digraph is called a **Fundamental Cycle** *(FC) if J_0 contains an endpoint c s.t. $f^k(c)$ is an endpoint of J_k for $1 \leq k < n$.*

FC always exists and unique. In the FC some vertex must occur at least twice among $J_0, ..., J_{n-1}$, since digraph has only $n-1$ vertices. On the other hand, every vertex occurs at most twice, since interval I_k has two endpoints.

Definition 1.4

Cycle in a digraph is said to be primitive if it does not consisit entirely of a cycle of smaller length described several times.

If FC contains I_k twice then it can be decomposed into two cycles of smaller length, each of which contains I_k once, and consequently is primitive.

Proof of Sharkovski's Theorem

Straffin's Lemma

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$
Lemma 4 (w. $J_m = J_0$) $\Rightarrow \exists\, y \in J_0\ f^m(y) = y$, $f^k(y) \in J_k (0 \leq k < m)$

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$
Lemma 4 (w. $J_m = J_0$) $\Rightarrow \exists\, y \in J_0\ f^m(y) = y$, $f^k(y) \in J_k (0 \leq k < m)$
Either m is a period of y or period of y is a factor of m.

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$
Lemma 4 (w. $J_m = J_0$) $\Rightarrow \exists\, y \in J_0\ f^m(y) = y$, $f^k(y) \in J_k (0 \leq k < m)$
Either m is a period of y or period of y is a factor of m. If y is not an endpoint of J_0, then m is a period of y since cycle is primitive.

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$
Lemma 4 (w. $J_m = J_0$) $\Rightarrow \exists\ y \in J_0\ f^m(y) = y$, $f^k(y) \in J_k (0 \leq k < m)$
Either m is a period of y or period of y is a factor of m. If y is not an endpoint of J_0, then m is a period of y since cycle is primitive. Assume y is an endpoint of J_0.

Lemma 6

Suppose f has a periodic point of period $n > 1$. If the associated digraph contains a primitive cycle

$$J_0 \to J_1 \to \cdots \to J_{m-1} \to J_0$$

of length m, then f has a periodic point y of period m such that $f^k(y) \in J_k (0 \leq k < m)$.

Proof. $J_1 \subseteq f(J_0), J_2 \subseteq f(J_1), \cdots, J_{m-1} \subseteq f(J_{m-2}), J_0 \subseteq f(J_{m-1})$
Lemma 4 (w. $J_m = J_0$) $\Rightarrow \exists\, y \in J_0 \; f^m(y) = y$, $f^k(y) \in J_k (0 \leq k < m)$
Either m is a period of y or period of y is a factor of m. If y is not an endpoint of J_0, then m is a period of y since cycle is primitive. Assume y is an endpoint of J_0. Since y is an element of n-orbit $\Rightarrow$ n is a divisor of m. We have $J_k \subseteq f(J_{k-1})$ and $f^k(y) \in J_k \Rightarrow J_k$ is defined uniquely and moreover, cycle is a multiple of the FC. Contradiction, since cycle is primitive. □

Suppose f has a 3-orbit: $f(c) < c < f^2(c)$ with corresponding digraph

$$\circlearrowright I_1 \rightleftarrows I_2$$

Proof of Sharkovski's Theorem

Straffin's Lemma $\Rightarrow 3 \prec m \prec 2 \prec 1$

Suppose f has a 3-orbit: $f(c) < c < f^2(c)$ with corresponding digraph

$$\circlearrowright I_1 \rightleftarrows I_2$$

$I_1 \to I_1 \Rightarrow$ there is a fixed point;

Suppose f has a 3-orbit: $f(c) < c < f^2(c)$ with corresponding digraph

$$\circlearrowright I_1 \rightleftarrows I_2$$

$I_1 \to I_1 \Rightarrow$ there is a fixed point; $I_1 \to I_2 \to I_1 \Rightarrow$ there is a 2-orbit

Suppose f has a 3-orbit: $f(c) < c < f^2(c)$ with corresponding digraph

$$\circlearrowright I_1 \rightleftarrows I_2$$

$I_1 \to I_1 \Rightarrow$ there is a fixed point; $I_1 \to I_2 \to I_1 \Rightarrow$ there is a 2-orbit
$\forall$ positive integer $m > 2$ there is an m-orbit corresponding to primitive cycle of length m: $I_1 \to I_2 \to I_1 \to I_1 \to \cdots \to I_1$

Lemma 7

If f has a periodic point of period > 1, then it has a fixed point and a periodic point of period 2.

Proof. Digraph has a loop $\Rightarrow$ there is a fixed point. Let $n > 1$ be the least positive integer such that f has a periodic point of period n. If $n > 2$ decompose FC into two primitive cycles. Since at least one of these has length greater than 1, by Straffin's lemma we deduce there is a periodic point of period strictly between 1 and n. $\square$

Lemma 8

Suppose f has a periodic orbit of odd period $n > 1$, but no periodic orbit of odd period strictly between 1 and n. If c is the midpoint of the orbit of odd period n, then the points of this orbit have the order

$$f^{n-1}(c) < f^{n-3}(c) < \cdots < f^2(c) < c < f(c) < \cdots < f^{n-2}(c)$$

or the inverse order

$$f^{n-2}(c) < \cdots < f(c) < c < f^2(c) < \cdots < f^{n-3}(c) < f^{n-1}(c)$$

and associated digraph is given in the figure, where $J_1 =< c, f(c) >$ and $J_k =< f^{k-2}(c), f^k(c) >$ for $1 < k < n$.

$$\begin{tikzcd}
J_1 \arrow[loop left] \arrow[r] & J_2 \arrow[r] & J_3 \arrow[r] & \cdots \arrow[r] & J_{n-3} \arrow[r] & J_{n-2} \arrow[r] & J_{n-1} \arrow[llllll, bend left] \arrow[llll, bend left] \arrow[l, bend left]
\end{tikzcd}$$

Proof. Decompose FC into two primitive cycles, one of which has odd length.

Proof of Sharkovski's Theorem

Proof of Lemma 8

Proof. Decompose FC into two primitive cycles, one of which has odd length. Its length must be 1!

Proof. Decompose FC into two primitive cycles, one of which has odd length. Its length must be 1! Thus FC has the form

$$J_1 \to J_1 \to J_2 \to \cdots \to J_{n-1} \to J_1$$

where $J_i \neq J_1$ for $1 < i < n$.

Proof. Decompose FC into two primitive cycles, one of which has odd length. Its length must be 1! Thus FC has the form

$$J_1 \to J_1 \to J_2 \to \cdots \to J_{n-1} \to J_1$$

where $J_i \neq J_1$ for $1 < i < n$. If $J_i = J_k$, $1 < i < k < n$, then we obtain a smaller primitive cycle, and by excluding the loop at J_1 if necessary, we can arrange that its length is odd. Hence, $J_1, ..., J_{n-1}$ are all distinct and thus a permutation of $I_1, ..., I_{n-1}$.

Proof. Decompose FC into two primitive cycles, one of which has odd length. Its length must be 1! Thus FC has the form

$$J_1 \to J_1 \to J_2 \to \cdots \to J_{n-1} \to J_1$$

where $J_i \neq J_1$ for $1 < i < n$. If $J_i = J_k$, $1 < i < k < n$, then we obtain a smaller primitive cycle, and by excluding the loop at J_1 if necessary, we can arrange that its length is odd. Hence, $J_1, ..., J_{n-1}$ are all distinct and thus a permutation of $I_1, ..., I_{n-1}$. Similarly, we cannot have $J_i \to J_k$ if $k > i + 1$ or if $k = 1$ and $i \neq 1, n + 1$.

Proof. Decompose FC into two primitive cycles, one of which has odd length. Its length must be 1! Thus FC has the form

$$J_1 \to J_1 \to J_2 \to \cdots \to J_{n-1} \to J_1$$

where $J_i \neq J_1$ for $1 < i < n$. If $J_i = J_k$, $1 < i < k < n$, then we obtain a smaller primitive cycle, and by excluding the loop at J_1 if necessary, we can arrange that its length is odd. Hence, $J_1, ..., J_{n-1}$ are all distinct and thus a permutation of $I_1, ..., I_{n-1}$. Similarly, we cannot have $J_i \to J_k$ if $k > i + 1$ or if $k = 1$ and $i \neq 1, n + 1$. Suppose $J_1 = I_k = [a, b]$. Since $\circlearrowleft J_1 \to J_2 \Rightarrow J_2$ is adjacent to J_1 and either

$$x_k = a,\ x_{k+1} = f(a),\ x_{k-1} = f^2(a)$$

or

or

$$x_{k+1} = b,\ x_k = f(b),\ x_{k+2} = f^2(b).$$

Proof of Sharkovski's Theorem

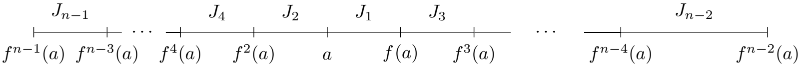
Proof of Lemma 8

Consider the first case, the argument in the second being similar. If $f^3(a) < f^2(a)$ then $J_2 \to J_1$, which is forbidden. Hence $f^3(a) > f^2(a)$.

Consider the first case, the argument in the second being similar. If $f^3(a) < f^2(a)$ then $J_2 \to J_1$, which is forbidden. Hence $f^3(a) > f^2(a)$. Since J_2 is not directed to J_k for $k > 3$ it follows that $J_3 = [f(a), f^3(a)]$ is adjacent to J_1 on the right.

Consider the first case, the argument in the second being similar. If $f^3(a) < f^2(a)$ then $J_2 \to J_1$, which is forbidden. Hence $f^3(a) > f^2(a)$. Since J_2 is not directed to J_k for $k > 3$ it follows that $J_3 = [f(a), f^3(a)]$ is adjacent to J_1 on the right. If $f^4(a) > f^3(a)$ then $J_3 \to J_1$, which is forbidden. Hence $f^4(a) < f^2(a)$ and, since J_3 is not directed to J_k for $k > 4$, $J_4 = [f^4(a), f^2(a)]$ is adjacent to J_2 on the left.

Consider the first case, the argument in the second being similar. If $f^3(a) < f^2(a)$ then $J_2 \to J_1$, which is forbidden. Hence $f^3(a) > f^2(a)$. Since J_2 is not directed to J_k for $k > 3$ it follows that $J_3 = [f(a), f^3(a)]$ is adjacent to J_1 on the right. If $f^4(a) > f^3(a)$ then $J_3 \to J_1$, which is forbidden. Hence $f^4(a) < f^2(a)$ and, since J_3 is not directed to J_k for $k > 4$, $J_4 = [f^4(a), f^2(a)]$ is adjacent to J_2 on the left. Proceeding in this way we see that the order of the J_is on the real line is given by



Since the endpoints of $J_{n-1} = [x_1, x_2]$ are mapped into a and $f^{n-2}(a) = x_n$ we have $J_{n-1} \to J_k$ iff k is odd. We found all the arcs in the digraph. □
